
WORKSHOP 24

Buckling Analysis of a Euler Column

Objectives:

- Create the geometry for a cantilever beam.
- Load the beam axially.
- Set up and run a buckling analysis of the beam.

Model Description:

Below is a finite element representation of the axially loaded beam shown on the title page. The material and beam properties are listed below.

Figure 24.1 - Load Conditions

Table 24.1 - Material Properties

Youngs Modulus:	10E+06 psi
Poisson's Ratio:	0.3
Density:	0.101 lb/in³
Plate Thickness:	0.1 in
Bar Cross-Sectional Area:	1.525 in²
I_{aa}:	4.0568 in⁴
I_{bb}:	0.3343 in⁴
J:	0.0251 in⁴

Exercise Procedure:

1. Start up MSC.Nastran or Windows V4.0 and begin to create a new model.

Double click on the icon labeled **MSC.Nastran for Windows V4.0**.

On the *Open Model File* form, select **New Model**.

Open Model File:

New Model

2. Create a material called **mat_1**.

From the pulldown menu, select **Model/Material**.

Model/Material...

Title:

mat_1

Youngs Modulus:

10E6

Poisson's Ratio:

0.3

Mass Density:

0.101

OK

Cancel

3. Create a property called **prop_1** to apply to the members of the beam.

From the pulldown menu, select **Model/Property**.

Model/Property...

Title:

prop_1

Material:

1..mat_1

Elem/Property Type...

Change the property type from plate elements (default) to bar elements.

Line Elements:

Bar

OK

A:

1.525

<i>I1:</i>	4.0568
<i>I2:</i>	0.3343
<i>J:</i>	0.0251
OK	
Cancel	

4. Create the Nastran geometry for the beam.

Mesh/Between...

<i>Property:</i>	1..prop_1
<i>Mesh Size/ #Nodes/ Dir 1:</i>	11
OK	

	<i>X:</i>	<i>Y:</i>	<i>Z:</i>
<i>Corner 1:</i>	0	0	0
OK			

	<i>X:</i>	<i>Y:</i>	<i>Z:</i>
<i>Corner 2:</i>	0	50	0
OK			

Now, specify the orientation vector for the bar elements.

	<i>X:</i>	<i>Y:</i>	<i>Z:</i>
<i>Base:</i>	0	0	0
<i>Tip:</i>	1	0	0
OK			

To fit the display onto the screen, use the **Autoscale** feature.

View/Autoscale <Ctrl+A>

Rotate to an isometric view.

View/Rotate... <F8>

Isometric

OK

Turn off the workplane.

Tools/Workplane... <F2>

Draw Workplane

Done

View/Regenerate... <Ctrl+G>

5. Create the model constraints.

Before creating the appropriate constraints, a constraint set needs to be created. Do so by performing the following:

Model/Constraint/Set...

Title:

constraint_1

OK

Now define the relevant constraint for the model.

Model/Constraint/Nodal...

<Select Node 1>

OK

On the *DOF* box, select all 6 boxes.

TX **TY** **TZ**
 RX **RY** **RZ**

OK

Cancel

6. Create the model loading.

Like the constraints, a load set must first be created before creating the appropriate model loading.

Model/Load/Set...

Title:

load_1

OK

Now, define the 1 lbf axial force.

Model/Load/Nodal...

<Select Node 11>

OK

Highlight Force.

FY

Force

-1

OK

Cancel

7. Run the analysis

File/Export/Analysis Model...

Analysis Format/Type:

7..Buckling

OK

Change the directory to C:\Temp.

File Name:

buckling

Write

Additional Info:

Run Analysis

OK

When asked if you wish to save the model, respond **Yes**.

Yes

File Name:

buckling

Save

When the MSC.Nastran manager is through running, MSC.Nastran will be restored on your screen, and the *Message Review* form will appear. To read the messages, you could select **Show Details**. Since the analysis ran successfully, we will not bother with the details this time.

Continue

8. Look at the results to determine the first three eigenvalues.

Answer the following questions:

What are the first eigenvalue?

Eigenvalue 1 = _____

HINT: Use **View/Select, Deformed and Contour Data, Output Set** or **List/Output/Query..., Output to List/Output Set**.

$$\begin{aligned} P_{cr} &= P_{\text{applied}} * \text{Eigenvalue 1} \\ &= 1.0 \times 3299.412 = 3299.4 \text{ lb} \end{aligned}$$

9. Theory.

Classic Euler:

$$P_{cr} = \frac{TL^2 EA}{\left(\frac{L'}{\rho}\right)^2}$$

$$L' = \frac{L}{\sqrt{C}} = \frac{50}{\sqrt{.25}} = 100$$

$$\rho = \sqrt{\frac{I}{A}} = \sqrt{\frac{0.3343}{1.525}} = 0.468$$

Thus,

$$\begin{aligned} P_{cr} &= \frac{TL^2 (10e6)(1.525)}{\left(\frac{100}{0.468}\right)^2} \\ &= \mathbf{3299.4 \text{ lb}} \end{aligned}$$

This concludes the exercise.

File/Save

File/Exit

<i>Eigenvalue 1</i>	3299.412
<i>Eigenvalue 2</i>	29696.69
<i>Eigenvalue 3</i>	33527.16
